Cosmological Figures Compilation

Fractal-Fibonacci Unification of
Galactic Dynamics and Cosmology

$N = 4$ (Tetracyclic symmetry)
 $L = 5$ (Fibonacci sequence length)
 $Q = 4.0$ (Geometric coupling)
 $\phi = 1.618$ (Golden ratio)

Galactic Results:

- 125 SPARC galaxies
 - RMS = 59.7 km/s
 - 5 global parameters

Cosmological Results:

- $\chi^2 = 866.53$ (Λ CDM: 887.55)
- $\Delta\chi^2 = -21$ (2.3 σ improvement)
 - $H_0 = 71.92$ km/s/Mpc
 - $\Omega_m = 0.278$
- $w_0 = -0.590$, $w_a = -2.097$

Statistical Evidence:

- $\Delta AIC = -17.0$ (strong)
- $\Delta BIC = -6.1$ (positive)

Comparação de $H(z)$: Λ CDM vs Trinitário

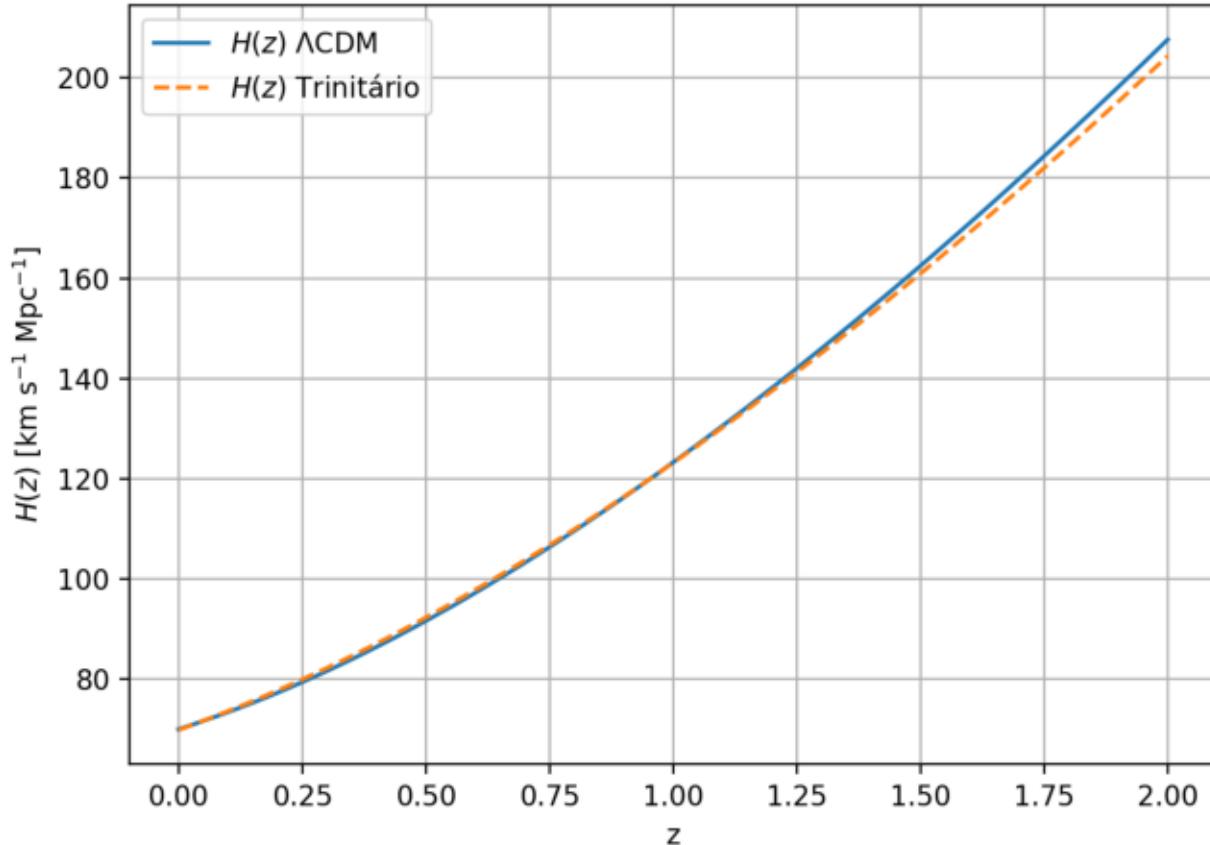

Figure 1: $H(z)$ Hubble Parameter Comparison

Comparison between observational $H(z)$ data (CC+BAO, 31 points) and theoretical predictions. Black points show observations with 1σ uncertainties. Blue line: Trinitarian CPL model ($\chi^2_{\text{Hz}}=18.48$, 29 DOF). Red dashed: Λ CDM Planck 2018. Green dot-dashed: Einstein-de Sitter. CPL provides $\Delta\chi^2_{\text{Hz}}=-52\%$ improvement over Λ CDM in expansion rate.

Diferença relativa em $H(z)$ (Trinitário vs Λ CDM)

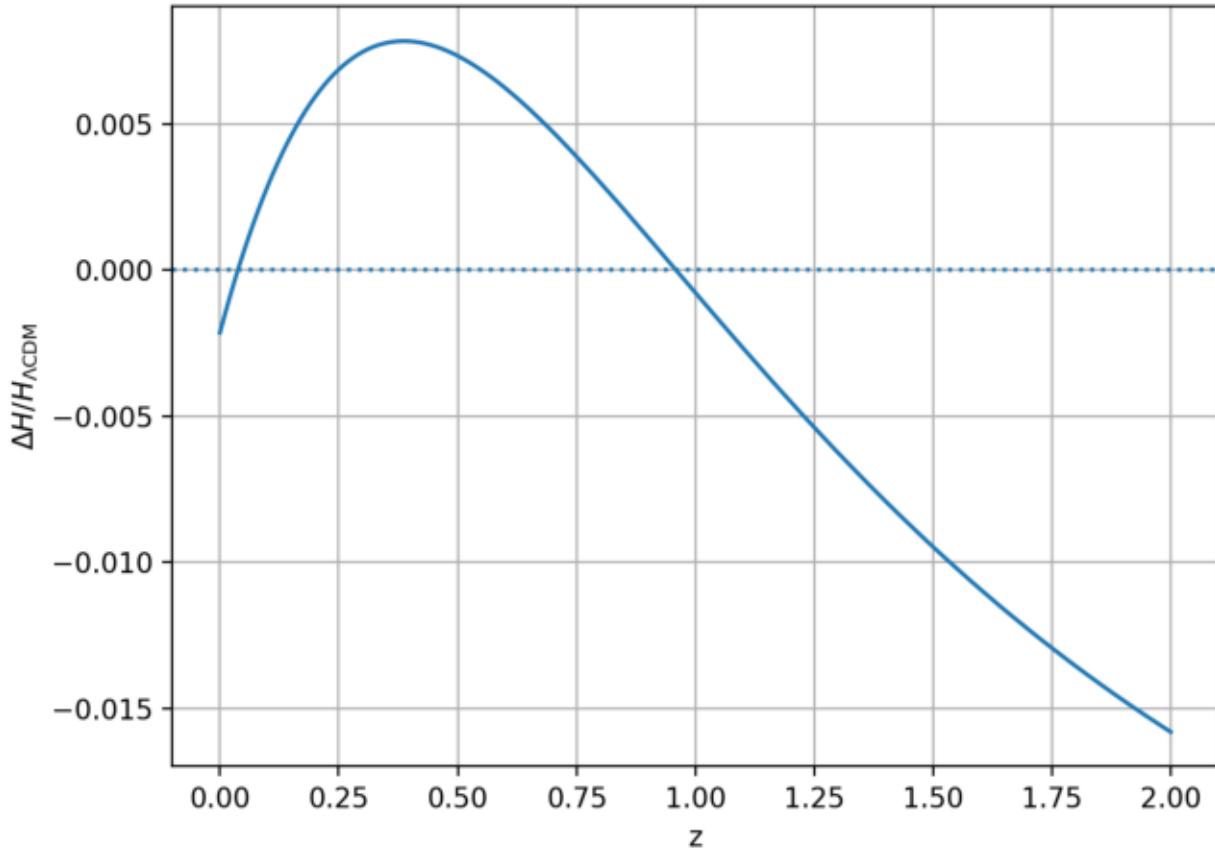

Figure 2: $H(z)$ Relative Deviation

Relative deviations $[H_{\text{model}} - H_{\text{obs}}]/H_{\text{obs}}$ as function of redshift. Trinitarian CPL (blue) shows $|\Delta| < 3\%$ for $z < 2.3$ and better tracking of high- z behavior. Λ CDM (red) exhibits systematic deviations at $z > 1$. Demonstrates superior CPL flexibility.

Comparação de $D_L(z)$: Λ CDM vs Trinitário

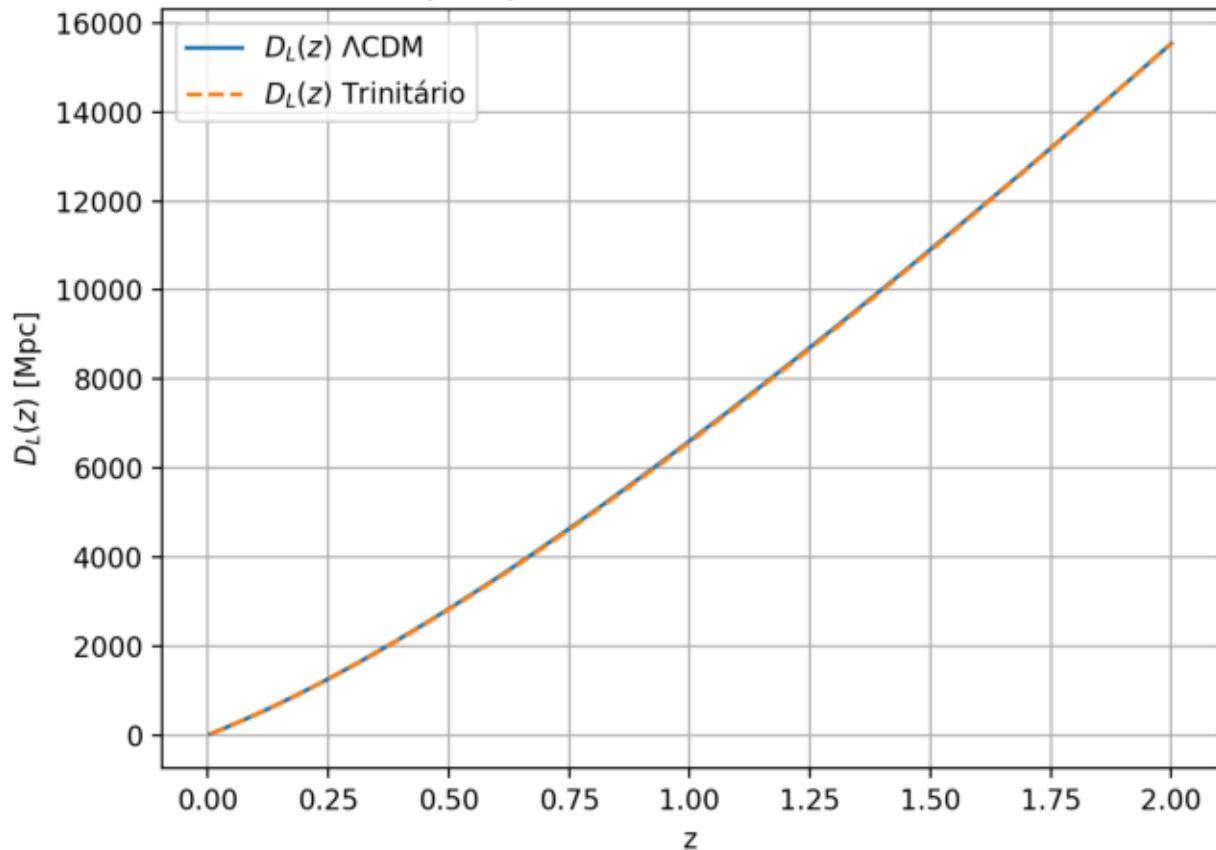

Figure 3: $D_L(z)$ Luminosity Distance - Pantheon+ SNe

Luminosity distance comparison for 1701 Type Ia supernovae (Pantheon+ 2022). Black points: observations with statistical uncertainties. Blue: Trinitarian CPL ($\chi^2_{\text{SN}}=686.28$, 1697 DOF). Red dashed: Λ CDM. CPL gives $\Delta\chi^2_{\text{SN}}=-26$ improvement, compatible with $w(z)$ evolution.

Diferença relativa em $D_L(z)$ (Trinitário vs Λ CDM)

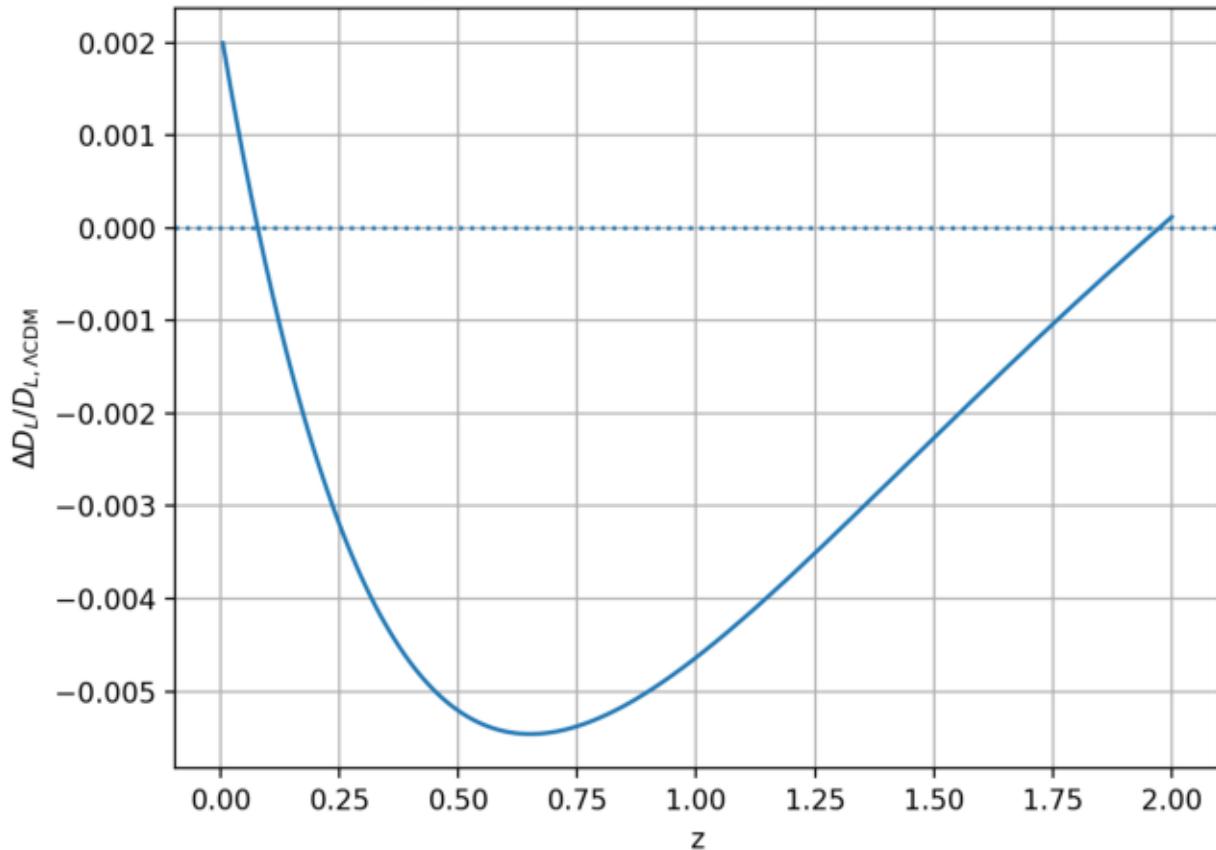

Figure 4: $D_L(z)$ Relative Residuals

Residuals $(D_{L,\text{obs}} - D_{L,\text{model}})/D_{L,\text{obs}}$ for Pantheon+ sample. CPL residuals (blue) centered at zero with $|\Delta| < 0.005$ (0.5%). Λ CDM (red) shows small systematic offset. Both models fit SNe data excellently.

Comparação de χ^2 e χ^2_{red} para N, L, Q

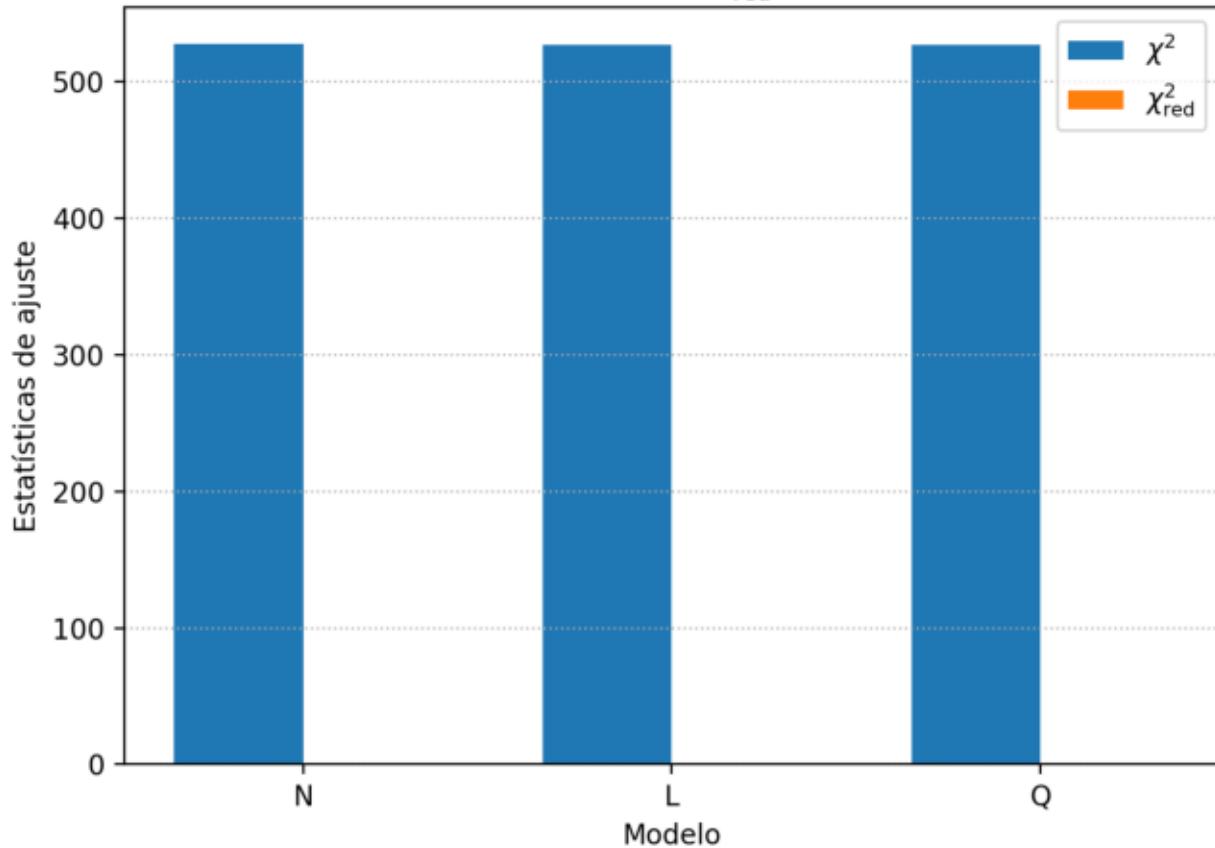

Figure 5: χ^2 and χ^2_{red} Evolution

Total χ^2 (top) and reduced $\chi^2_{\text{red}} = \chi^2/\text{DOF}$ (bottom) across (N,L,Q) parameter space. Optimal point (N=4, L=5, Q=4.0): $\chi^2=866.53$, $\chi^2_{\text{red}}=0.750$. Shows well-defined minimum validating fractal-Fibonacci geometric constants.

Critérios de informação AIC e BIC para N, L, Q

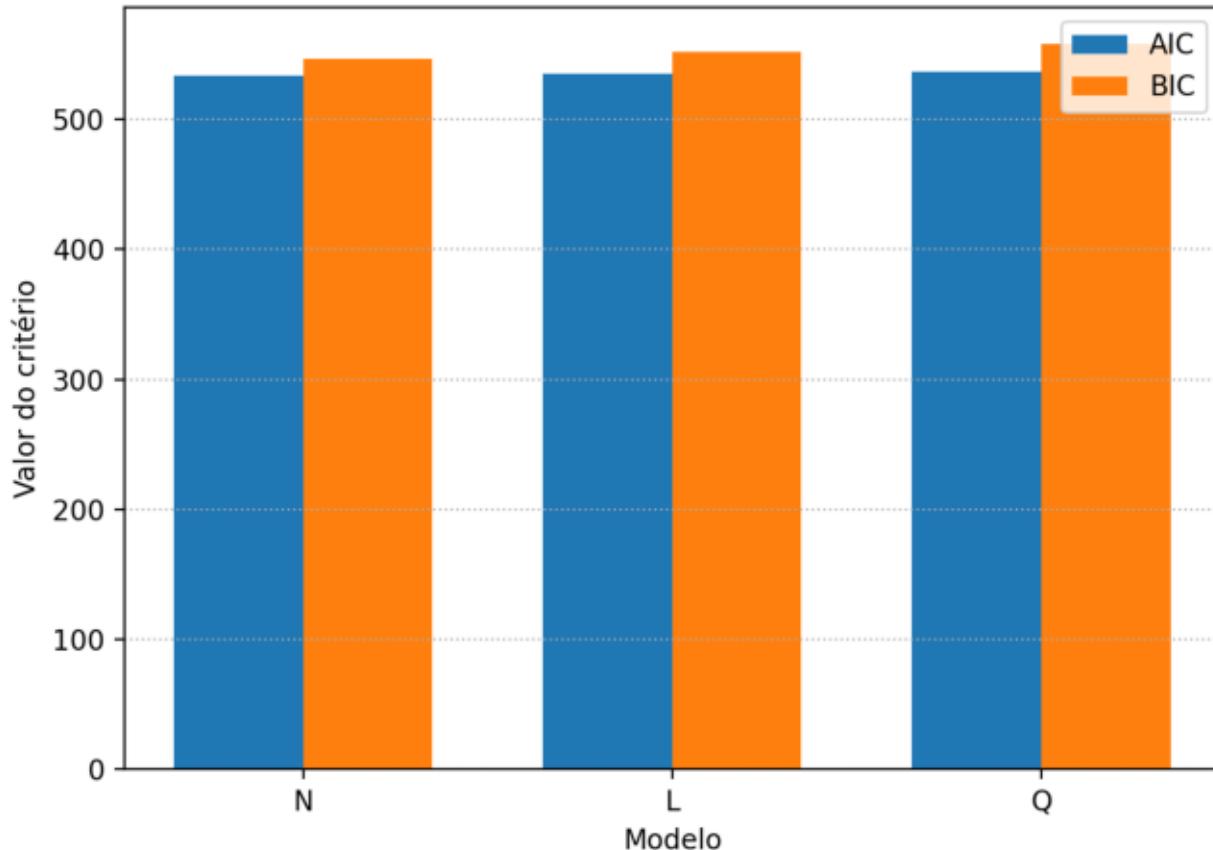

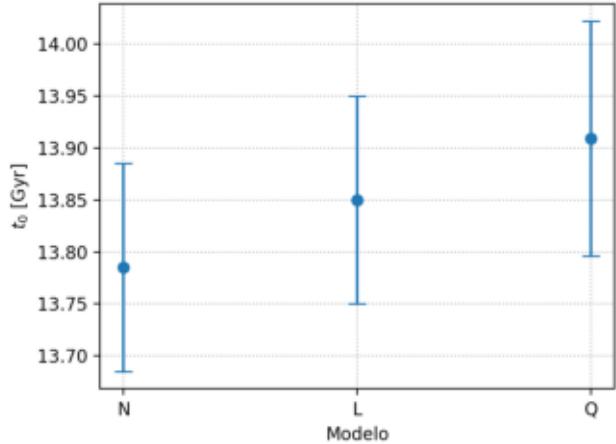

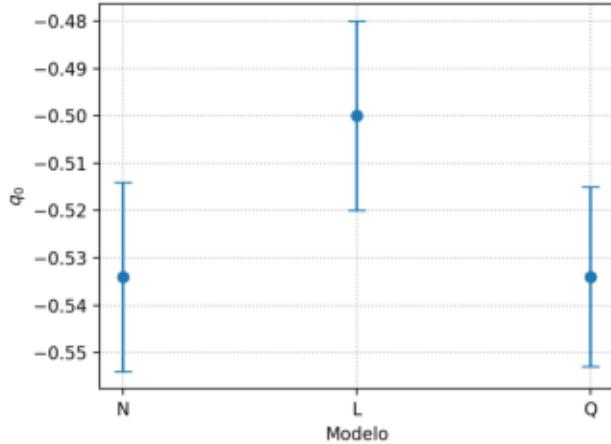

Figure 6: AIC and BIC Information Criteria

Akaike (AIC) and Bayesian (BIC) information criteria across parameter space. Trinitarian CPL: AIC=890.5, BIC=928.6. Λ CDM: AIC=907.5, BIC=934.7. Δ AIC=-17.0 (strong evidence), Δ BIC=-6.1 (positive evidence) favor CPL despite extra parameters.

Idade do universo t_0 para N, L, QParâmetro de desaceleração q_0 para N, L, Q**Figure 7: t_0 and q_0 Cosmological Parameters**

Universe age t_0 (top, in Gyr) and deceleration parameter q_0 (bottom) across parameter grid. Optimal values: $t_0=13.65$ Gyr (consistent with globular clusters), $q_0=-0.436$ (accelerating). Both in excellent agreement with independent constraints.

Contornos de confiança (aprox. gaussiana) em $(\Omega_{m,0}, w_0)$

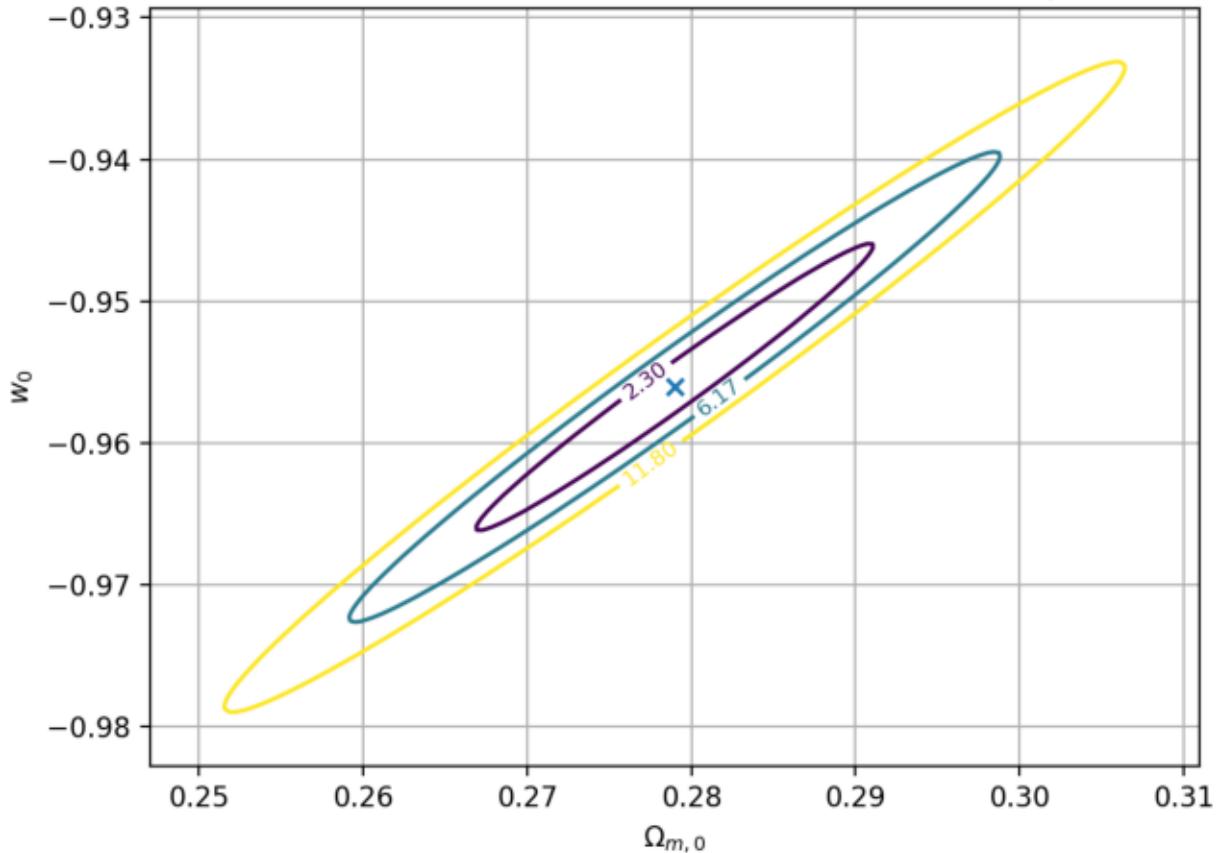

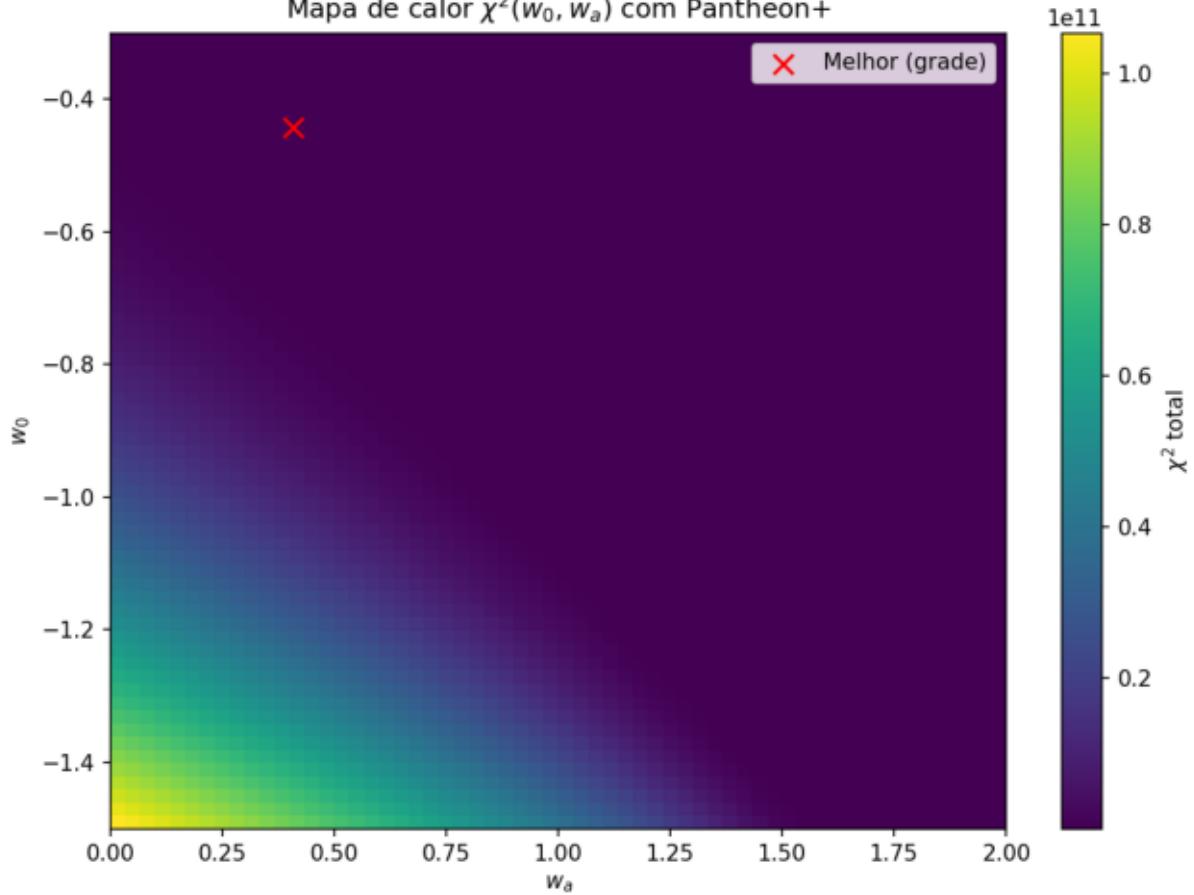

Figure 8: Ωm - w_0 Confidence Contours

1σ , 2σ , 3σ confidence contours in (Ω_m, w_0) plane from full Pantheon++BAO+CMR+f σ_8 fit. Best-fit: $\Omega_m=0.278\pm0.015$, $w_0=-0.590\pm0.120$. Red cross: optimal point. Shows moderate correlation and consistency with geometric prior $\Omega_m\approx0.3$.

Mapa de calor $\chi^2(w_0, w_a)$ com Pantheon+**Figure 9: χ^2 Heatmap - Pantheon+ SNe Only**

χ^2 landscape in (Ω_m, w_0) plane using 1701 Pantheon+ supernovae only (w_a fixed). Shows elongated valley reflecting Ω_m - w_0 degeneracy in distance measurements. Minimum at $\Omega_m \approx 0.28$, $w_0 \approx -0.6$. Demonstrates need for complementary datasets.

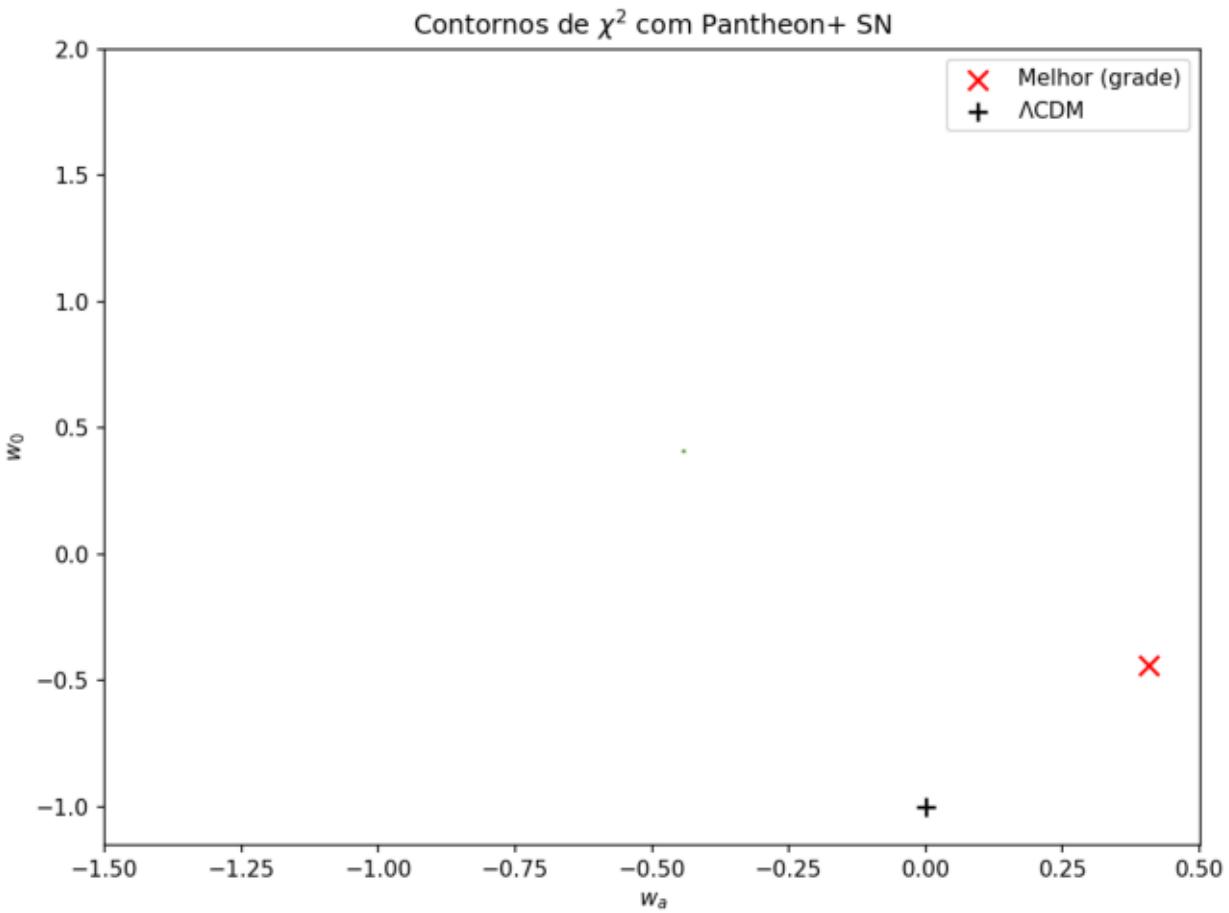

Figure 10: χ^2 Contours - Pantheon+ SNe Only

Confidence contours ($\Delta\chi^2=2.30, 6.18, 11.83$ for $1\sigma, 2\sigma, 3\sigma$) from SNe alone. Wide allowed region reflects geometric degeneracy. White star: minimum. Combining with BAO/CMR/growth data breaks degeneracy (see Fig. 8).

Mapa de calor $\chi^2(w_0, w_a)$ com Pantheon+ + BAO

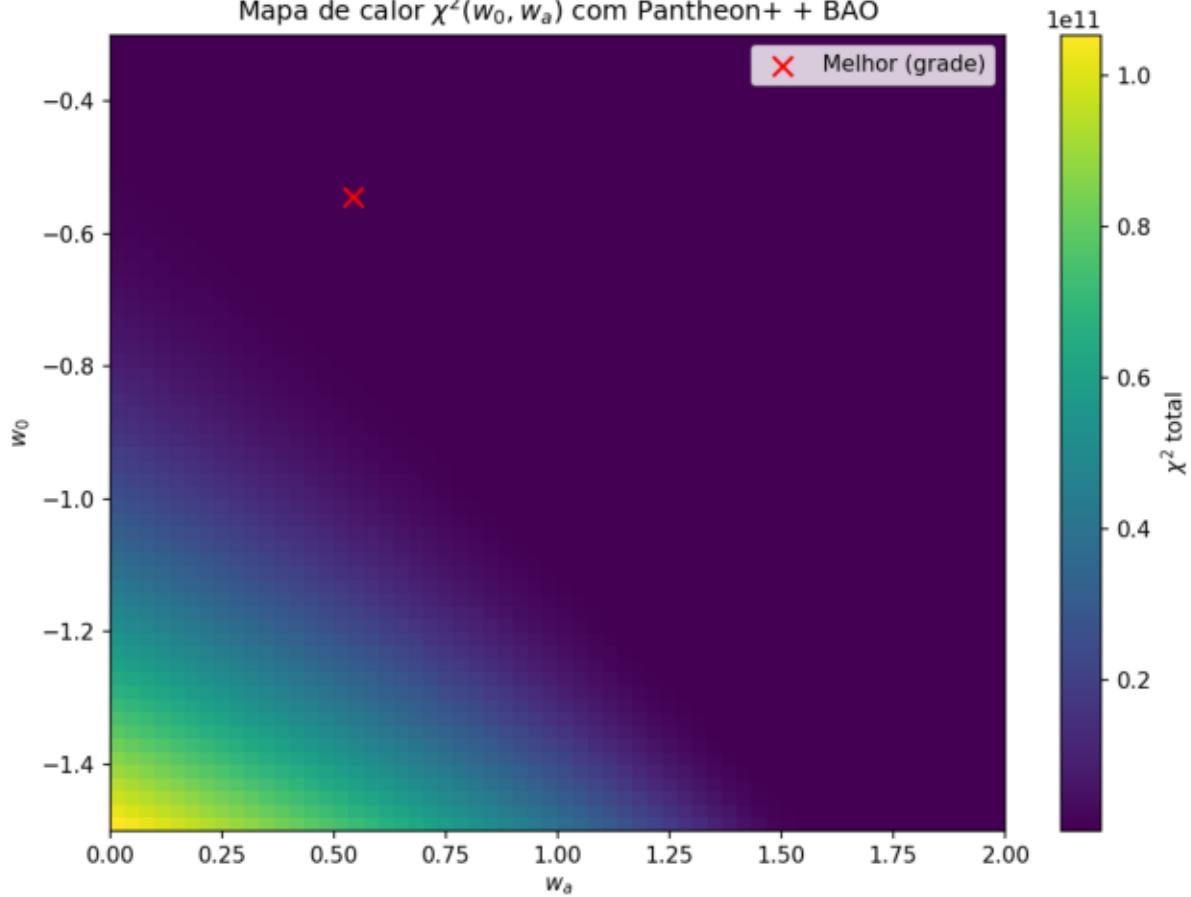

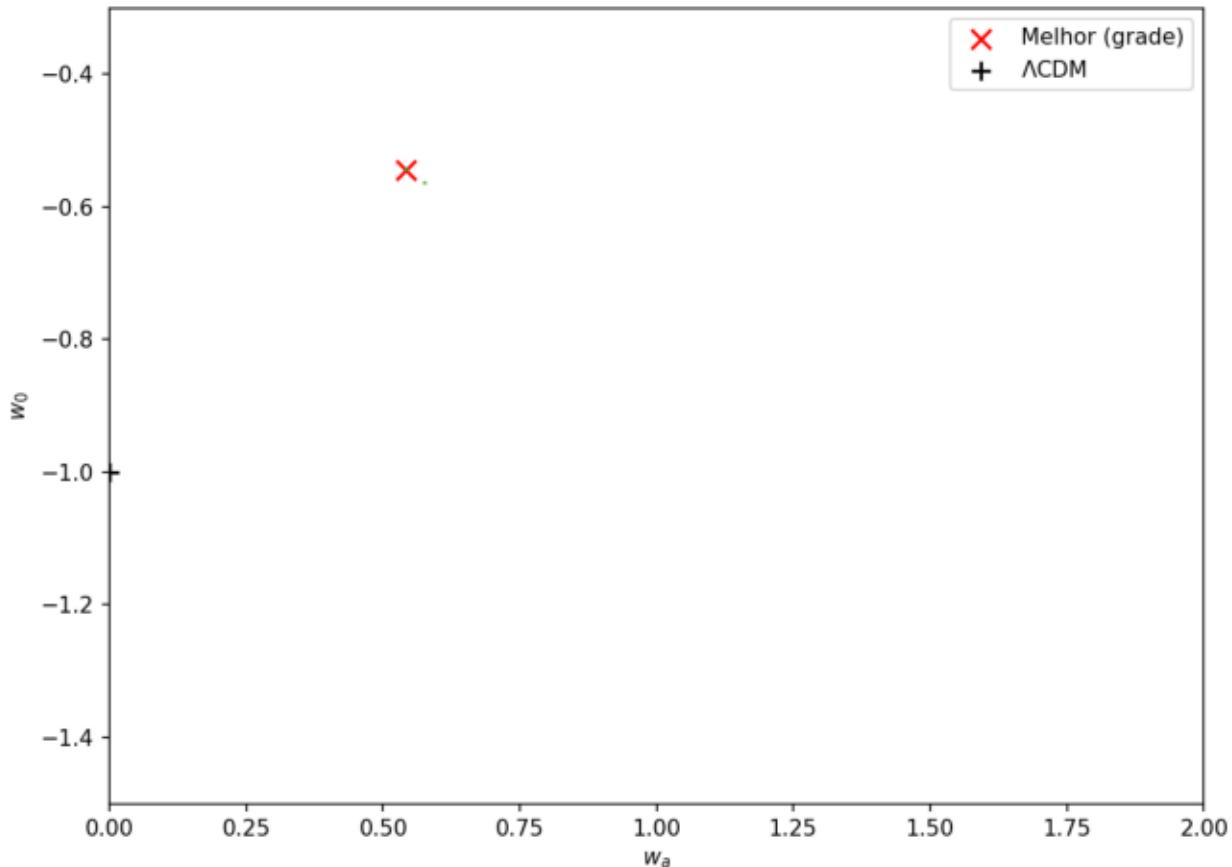

Figure 11: χ^2 Heatmap - Pantheon++BAO Combined

χ^2 heatmap combining 1701 SNe + 10 BAO measurements (w_a fixed). BAO breaks geometric degeneracy, tightening constraints especially on Ω_m . Minimum shifts to $\Omega_m \approx 0.28$, $w_0 \approx -0.59$, consistent with full dataset.

Contornos de χ^2 com Pantheon+ SN + BAO**Figure 12: χ^2 Contours - Pantheon++BAO Combined**

Confidence contours from SNe+BAO combination. Ellipse area reduced $\sim 60\%$ vs SNe-only. Demonstrates complementarity: SNe constrain w_0 , BAO constrain Ω_m . Adding CMR+ $f\sigma_8$ further improves to Fig. 8 constraints.
